Features

- High-performance, Low-power AVR® 8-bit Microcontroller
- Advanced RISC Architecture
  - 133 Powerful Instructions – Most Single Clock Cycle Execution
  - 32 x 8 General Purpose Working Registers + Peripheral Control Registers
  - Fully Static Operation
  - Up to 16 MIPS Throughput at 16 MHz
  - On-chip 2-cycle Multiplier
- Nonvolatile Program and Data Memories
  - 128K Bytes of In-System Reprogrammable Flash
    Endurance: 10,000 Write/Erase Cycles
  - Optional Boot Code Section with Independent Lock Bits
    In-System Programming by On-chip Boot Program
    True Read-While-Write Operation
  - 4K Bytes EEPROM
    Endurance: 100,000 Write/Erase Cycles
  - 4K Bytes Internal SRAM
  - Up to 64K Bytes Optional External Memory Space
  - Programming Lock for Software Security
  - SPI Interface for In-System Programming
- JTAG (IEEE std. 1149.1 Compliant) Interface
  - Boundary-scan Capabilities According to the JTAG Standard
  - Extensive On-chip Debug Support
  - Programming of Flash, EEPROM, Fuses and Lock Bits through the JTAG Interface
- Peripheral Features
  - Two 8-bit Timer/Counters with Separate Prescalers and Compare Modes
  - Two Expanded 16-bit Timer/Counters with Separate Prescaler, Compare Mode and Capture Mode
  - Real Time Counter with Separate Oscillator
  - Two 8-bit PWM Channels
  - 6 PWM Channels with Programmable Resolution from 2 to 16 Bits
  - Output Compare Modulator
  - 8-channel, 10-bit ADC
    8 Single-ended Channels
    7 Differential Channels
    2 Differential Channels with Programmable Gain at 1x, 10x, or 200x
  - Byte-oriented Two-wire Serial Interface
  - Dual Programmable Serial USARTs
  - Master/Slave SPI Serial Interface
  - Programmable Watchdog Timer with On-chip Oscillator
  - On-chip Analog Comparator
- Special Microcontroller Features
  - Power-on Reset and Programmable Brown-out Detection
  - Internal Calibrated RC Oscillator
  - External and Internal Interrupt Sources
  - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby, and Extended Standby
  - Software Selectable Clock Frequency
  - ATmega103 Compatibility Mode Selected by a Fuse
  - Global Pull-up Disable
- I/O and Packages
  - 53 Programmable I/O Lines
  - 64-lead TQFP and 64-pad MLF
- Operating Voltages
  - 2.7 - 5.5V for ATmega128L
  - 4.5 - 5.5V for ATmega128
- Speed Grades
  - 0 - 8 MHz for ATmega128L
  - 0 - 16 MHz for ATmega128

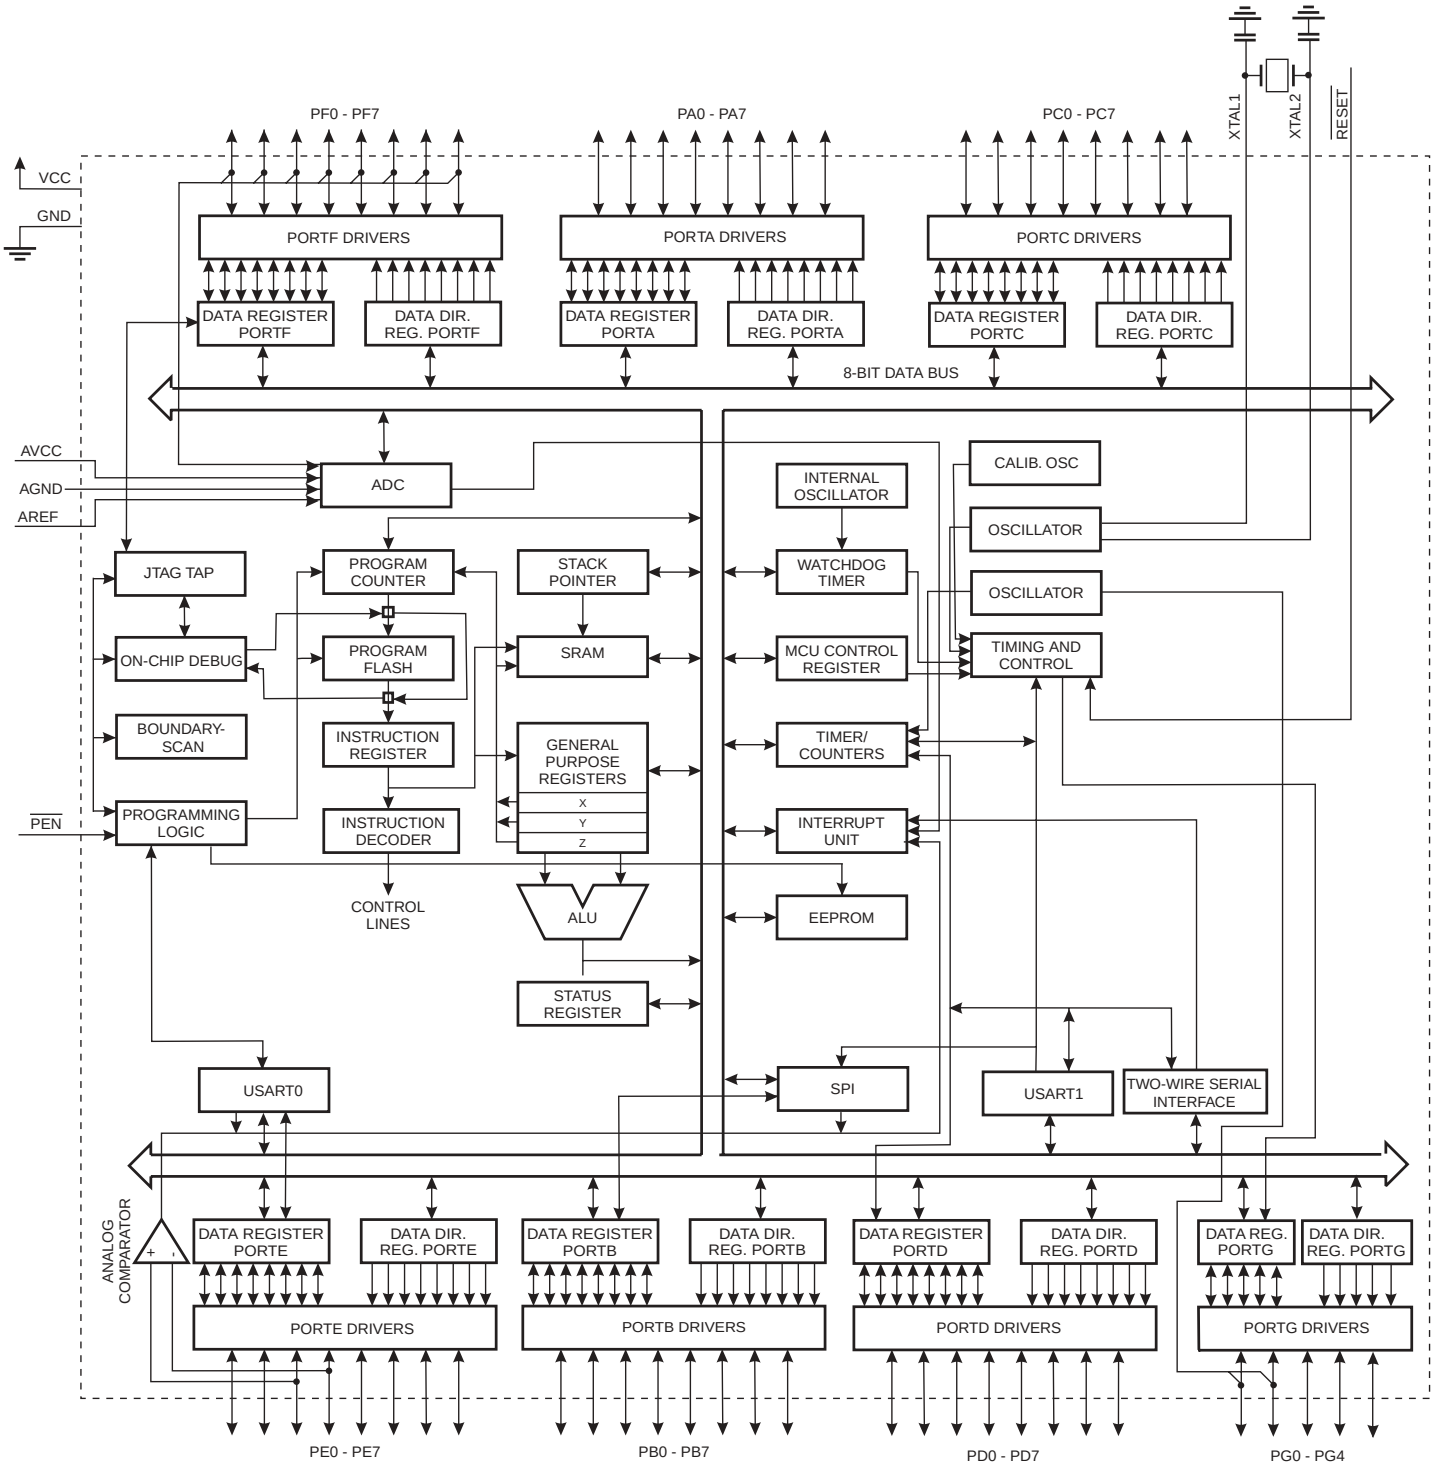
Overview

The ATmega128 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega128 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

Block Diagram

Figure 2. Block Diagram



The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega128 provides the following features: 128K bytes of In-System Programmable Flash with Read-While-Write capabilities, 4K bytes EEPROM, 4K bytes SRAM, 53 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), four flexible Timer/Counters with compare modes and PWM, 2 USARTs, a byte oriented Two-wire Serial Interface, an 8-channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega128 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega128 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

ATmega103 and ATmega128 Compatibility

The ATmega128 is a highly complex microcontroller where the number of I/O locations supersedes the 64 I/O locations reserved in the AVR instruction set. To ensure backward compatibility with the ATmega103, all I/O locations present in ATmega103 have the same location in ATmega128. Most additional I/O locations are added in an Extended I/O space starting from $60 to $FF, (i.e., in the ATmega103 internal RAM space). These locations can be reached by using LD/LDS/LDD and ST/STS/STD instructions only, not by using IN and OUT instructions. The relocation of the internal RAM space may still be a problem for ATmega103 users. Also, the increased number of interrupt vectors might be a problem if the code uses absolute addresses. To solve these problems, an ATmega103 compatibility mode can be selected by programming the fuse M103C. In this mode, none of the functions in the Extended I/O space are in use, so the internal RAM is located as in ATmega103. Also, the Extended Interrupt vectors are removed.

The ATmega128 is 100% pin compatible with ATmega103, and can replace the ATmega103 on current Printed Circuit Boards. The application note “Replacing ATmega103 by ATmega128” describes what the user should be aware of replacing the ATmega103 by an ATmega128.

ATmega103 Compatibility Mode

By programming the M103C fuse, the ATmega128 will be compatible with the ATmega103 regards to RAM, I/O pins and interrupt vectors as described above. However, some new features in ATmega128 are not available in this compatibility mode, these features are listed below:

- One USART instead of two, Asynchronous mode only. Only the eight least significant bits of the Baud Rate Register is available.
- One 16 bits Timer/Counter with two compare registers instead of two 16-bit Timer/Counters with three compare registers.
- Two-wire serial interface is not supported.
- Port C is output only.
- Port G serves alternate functions only (not a general I/O port).
- Port F serves as digital input only in addition to analog input to the ADC.
- Boot Loader capabilities is not supported.
- It is not possible to adjust the frequency of the internal calibrated RC Oscillator.
- The External Memory Interface can not release any Address pins for general I/O, neither configure different wait-states to different External Memory Address sections.

In addition, there are some other minor differences to make it more compatible to ATmega103:

- Only EXTRF and PORF exists in MCUCSR.
- Timed sequence not required for Watchdog Time-out change.
- External Interrupt pins 3 - 0 serve as level interrupt only.
- USART has no FIFO buffer, so data overrun comes earlier.

Unused I/O bits in ATmega103 should be written to 0 to ensure same operation in ATmega128.

Pin Descriptions

VCC

Digital supply voltage.

GND

Ground.

Port A (PA7..PA0)

Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega128 as listed on page 69.

Port B (PB7..PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source

current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATmega128 as listed on page 70.

Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the ATmega128 as listed on page 73. In ATmega103 compatibility mode, Port C is output only, and the port C pins are **not** tri-stated when a reset condition becomes active.

Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega128 as listed on page 74.

Port E (PE7..PE0)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the ATmega128 as listed on page 77.

Port F (PF7..PF0)

Port F serves as the analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a Reset occurs.

The TDO pin is tri-stated unless TAP states that shift out data are entered.

Port F also serves the functions of the JTAG interface.

In ATmega103 compatibility mode, Port F is an input Port only.

Port G (PG4..PG0)

Port G is a 5-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features.

The port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

In ATmega103 compatibility mode, these pins only serves as strobes signals to the external memory as well as input to the 32 kHz Oscillator, and the pins are initialized to PG0 = 1, PG1 = 1, and PG2 = 0 asynchronously when a reset condition becomes active, even if the clock is not running. PG3 and PG4 are oscillator pins.

$\overline{\text{RESET}}$ Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in Table 19 on page 48. Shorter pulses are not guaranteed to generate a reset.

XTAL1 Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

XTAL2 Output from the inverting Oscillator amplifier.

AVCC AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to V_{CC}, even if the ADC is not used. If the ADC is used, it should be connected to V_{CC} through a low-pass filter.

AREF AREF is the analog reference pin for the A/D Converter.

PEN PEN is a programming enable pin for the SPI Serial Programming mode. By holding this pin low during a Power-on Reset, the device will enter the SPI Serial Programming mode. $\overline{\text{PEN}}$ has no function during normal operation.

$01 ($21)	PINE	PINE7	PINE6	PINE5	PINE4	PINE3	PINE2	PINE1	PINE0	84
$00 ($20)	PINF	PINF7	PINF6	PINF5	PINF4	PINF3	PINF2	PINF1	PINF0	85

Notes: 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.

2. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers $00 to $1F only.

Erratas

The revision letter in this section refers to the revision of the ATmega128 device.

ATmega128 Rev. H

There are no errata for this revision of ATmega128. However, a proposal for solving problems regarding the JTAG instruction IDCODE is presented below.

IDCODE masks data from TDI input

The public but optional JTAG instruction IDCODE is not implemented correctly according to IEEE1149.1; a logic one is scanned into the shift register instead of the TDI input while shifting the Device ID Register. Hence, captured data from the preceding devices in the boundary scan chain are lost and replaced by all-ones, and data to succeeding devices are replaced by all-ones during Update-DR.

If ATmega128 is the only device in the scan chain, the problem is not visible.

Problem Fix / Workaround

Select the Device ID Register of the ATmega128 (Either by issuing the IDCODE instruction or by entering the Test-Logic-Reset state of the TAP controller) to read out the contents of its Device ID Register and possibly data from succeeding devices of the scan chain. Note that data to succeeding devices cannot be entered during this scan, but data to preceding devices can. Issue the BYPASS instruction to the ATmega128 to select its Bypass Register while reading the Device ID Registers of preceding devices of the boundary scan chain. Never read data from succeeding devices in the boundary scan chain or upload data to the succeeding devices while the Device ID Register is selected for the ATmega128. Note that the IDCODE instruction is the default instruction selected by the Test-Logic-Reset state of the TAP-controller.

Alternative Problem Fix / Workaround

If the Device IDs of all devices in the boundary scan chain must be captured simultaneously (for instance if blind interrogation is used), the boundary scan chain can be connected in such way that the ATmega128 is the fist device in the chain. Update-DR will still not work for the succeeding devices in the boundary scan chain as long as IDCODE is present in the JTAG Instruction Register, but the Device ID registered cannot be uploaded in any case.

Datasheet Change Log for ATmega128

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

Changes from Rev. 2467I-09/03 to Rev. 2467J-12/03

1. **Updated “Calibrated Internal RC Oscillator” on page 39.**

Changes from Rev. 2467H-02/03 to Rev. 2467I-09/03

1. **Updated note in “XTAL Divide Control Register – XDIV” on page 41.**
2. **Updated “JTAG Interface and On-chip Debug System” on page 46.**
3. **Updated values for V_{BOT} (BODLEVEL = 1) in Table 19 on page 48.**
4. **Updated “Test Access Port – TAP” on page 247 regarding JTAGEN.**
5. **Updated description for the JTD bit on page 256.**
6. **Added a note regarding JTAGEN fuse to Table 119 on page 290.**
7. **Updated R_{PU} values in “DC Characteristics” on page 321.**
8. **Added a proposal for solving problems regarding the JTAG instruction IDCODE in “Erratas” on page 17.**

Changes from Rev. 2467G-09/02 to Rev. 2467H-02/03

1. **Corrected the names of the two Prescaler bits in the SFIOR Register.**
2. **Added Chip Erase as a first step under “Programming the Flash” on page 318 and “Programming the EEPROM” on page 319.**
3. **Removed reference to the “Multipurpose Oscillator” application note and the “32 kHz Crystal Oscillator” application note, which do not exist.**
4. **Corrected OCn waveforms in Figure 52 on page 122.**
5. **Various minor Timer1 corrections.**
6. **Added information about PWM symmetry for Timer0 and Timer2.**
7. **Various minor TWI corrections.**
8. **Added reference to Table 125 on page 293 from both SPI Serial Programming and Self Programming to inform about the Flash Page size.**
9. **Added note under “Filling the Temporary Buffer (Page Loading)” on page 282 about writing to the EEPROM during an SPM Page load.**
10. **Removed ADHSM completely.**
11. **Added section “EEPROM Write During Power-down Sleep Mode” on page 23.**
12. **Updated drawings in “Packaging Information” on page 15.**

Changes from Rev. 2467F-09/02 to Rev. 2467G-09/02

1. **Changed the Endurance on the Flash to 10,000 Write/Erase Cycles.**

Changes from Rev. 2467E-04/02 to Rev. 2467F-09/02

1. **Added 64-pad MLF Package and updated "Ordering Information" on page 14.**
2. **Added the section "Using all Locations of External Memory Smaller than 64 KB" on page 31.**
3. **Added the section "Default Clock Source" on page 35.**
4. **Renamed SPMCR to SPMCSR in entire document.**
5. **When using external clock there are some limitations regards to change of frequency. This is descried in "External Clock" on page 40 and Table 132, "External Clock Drive," on page 323.**
6. **Added a sub section regarding OCD-system and power consumption in the section "Minimizing Power Consumption" on page 45.**
7. **Corrected typo (WGM-bit setting) for:**

   "Fast PWM Mode" on page 95 (Timer/Counter0).

   "Phase Correct PWM Mode" on page 97 (Timer/Counter0).

   "Fast PWM Mode" on page 150 (Timer/Counter2).

   "Phase Correct PWM Mode" on page 152 (Timer/Counter2).
8. **Corrected Table 81 on page 192 (USART).**
9. **Corrected Table 103 on page 261 (Boundary-Scan)**
10. **Updated Vil parameter in "DC Characteristics" on page 321.**

Changes from Rev. 2467D-03/02 to Rev. 2467E-04/02

1. **Updated the Characterization Data in Section "ATmega128 Typical Characteristics – Preliminary Data" on page 333.**
2. **Updated the following tables:**

   Table 19 on page 48, Table 20 on page 52, Table 68 on page 157, Table 103 on page 261, and Table 136 on page 327.
3. **Updated Description of OSCCAL Calibration Byte.**

   In the data sheet, it was not explained how to take advantage of the calibration bytes for 2, 4, and 8 MHz Oscillator selections. This is now added in the following sections:

   Improved description of "Oscillator Calibration Register – OSCCAL" on page 39 and "Calibration Byte" on page 291.

Changes from Rev. 2467C-02/02 to Rev. 2467D-03/02

1. **Added more information about "ATmega103 Compatibility Mode" on page 5.**
2. **Updated Table 2, "EEPROM Programming Time," on page 21.**

3. **Updated typical Start-up Time in Table 7 on page 35, Table 9 and Table 10 on page 37, Table 12 on page 38, Table 14 on page 39, and Table 16 on page 40.**

4. **Updated Table 22 on page 54 with typical WDT Time-out.**

5. **Corrected description of ADSC bit in "ADC Control and Status Register A – ADCSRA" on page 244.**

6. **Improved description on how to do a polarity check of the ADC diff results in "ADC Conversion Result" on page 241.**

7. **Corrected JTAG version numbers in "JTAG Version Numbers" on page 254.**

8. **Improved description of addressing during SPM (usage of RAMPZ) on "Addressing the Flash During Self-Programming" on page 280, "Performing Page Erase by SPM" on page 282, and "Performing a Page Write" on page 282.**

9. **Added not regarding OCDEN Fuse below Table 119 on page 290.**

10. **Updated Programming Figures:**

    Figure 135 on page 292 and Figure 144 on page 304 are updated to also reflect that AVCC must be connected during Programming mode. Figure 139 on page 299 added to illustrate how to program the fuses.

11. **Added a note regarding usage of the PROG_PAGELOAD and PROG_PAGEREAD instructions on page 310.**

12. **Added Calibrated RC Oscillator characterization curves in section "ATmega128 Typical Characteristics – Preliminary Data" on page 333.**

13. **Updated "Two-wire Serial Interface" section.**

    More details regarding use of the TWI Power-down operation and using the TWI as master with low TWBRR values are added into the data sheet. Added the note at the end of the "Bit Rate Generator Unit" on page 203. Added the description at the end of "Address Match Unit" on page 204.

14. **Added a note regarding usage of Timer/Counter0 combined with the clock. See "XTAL Divide Control Register – XDIV" on page 41.**

Changes from Rev. 2467B-09/01 to Rev. 2467C-02/02

1. **Corrected Description of Alternate Functions of Port G**

   Corrected description of TOSC1 and TOSC2 in "Alternate Functions of Port G" on page 81.

2. **Added JTAG Version Numbers for rev. F and rev. G**

   Updated Table 100 on page 254.

3 **Added Some Preliminary Test Limits and Characterization Data**

   Removed some of the TBD's in the following tables and pages:

   Table 19 on page 48, Table 20 on page 52, "DC Characteristics" on page 321, Table 132 on page 323, Table 135 on page 325, and Table 136 on page 327.

4. **Corrected “Ordering Information” on page 14.**

5. **Added some Characterization Data in Section “ATmega128 Typical Characteristics – Preliminary Data” on page 333.**

6. **Removed Alternative Algortihm for Leaving JTAG Programming Mode.**
   See “Leaving Programming Mode” on page 318.

7. **Added Description on How to Access the Extended Fuse Byte Through JTAG Programming Mode.**
   See “Programming the Fuses” on page 320 and “Reading the Fuses and Lock Bits” on page 320.
